SQL is a standard language for accessing and manipulating databases. What is SQL? SQL stands for Structured Query Language SQL allows you to access and manipulate databases SQL became a standard of the American National Standards Institute (ANSI) in 1986, and of the International Organization for Standardization (ISO³³ in 1987 What© can SQL do? SQL can execute queries against a SQL database can retrieve data from a SQL database can insert records into a SQL database can update records in a SQL database can delete records from a SQL database can create new SQL databases can create new tables in a SQL database can create stored procedures in a SQL database can create views against a SQL database can set permissions on tables, procedures and views SQL is a standard - BUT.... Although SQL is an ANSI/ISO standard, there are different versions of SQL. However, to comply with the ANSI standard, all support at least the main commands (such as SELECT, UPDATE, DELETE, INSERT, WHERE) in a similar way. Note: Most SQL database programs also have their own proprietary extensions in addition to the SQL standard. Use SQL on the Web site To build a Web site that displays data from a database, you need: An RDBMS database program (for example, MS Access, SQL Server, MySQL) To use a server-side scripting language, such as PHP or ASP To use SQL to get the data you want To use HTML / CSS to style the RDBMS page RDBMS means Relational Database ³ Management System. RDBMS is the basis for SQL, and for all systems modern data such as MS SQL Server, IBM DB2, Oracle, MySQL and Microsoft Access. RDBMS data is stored in database objects called tables. A table is a collection of related data entries and consists of columns and rows.
